Overall benefits of the treatment

1. Destroys mould and fungi
2. Relieves asthma and hayfever
3. Eliminates unpleasant odours
4. Neutralises cigarette and pet smells
5. Provides healthier environment for vehicle occupants
6. Helps you breathe more clearly

Air conditioning questions answered

Q: Is your air conditioning bugging you . It is claimed that un-serviced air conditioning can lead to motorists suffering from "sick car syndrome" caused by a build up of bacteria in your air conditioning system.

A: We can remove these bacteria with a simple treatment. We remove the pollen filter and inject the treatment deep into the air intake where it will kill the bacteria, leaving you and your car healthier and fresher smelling.

Q: Do you suffer from symptoms like...Headaches, colds, hay fever or asthma?

A: these are common symptoms resulting from the build up of bacteria on the cooling elements of the air conditioning system, which can target those with low resistance to infection.

Q: Does your air conditioning system give off unpleasant odours?

A: The most obvious cause is a build up of bacteria in the system. The good news is air conditioning smells can be eliminated with a simple treatment.

Q: How often does air conditioning servicing need to be done?

A: Car air conditioning systems need servicing every couple of years, ideally when the car is between 2-4 years old to be fully effective, the job is often overlooked once the cars leave the comfort zone of their 3 year warranty.

Q: Is the treatment safe to use?

A: Our air conditioning treatment does not contain solvent cleaning agents so it is completely safe to use and will not affect any components, leather seats or wood and plastic trim.
